## ABSTRACT OF THE DISCLOSURE

A method and corresponding device for determining the phase- and/or amplitude data of an electromagnetic wave. In order to bring about the spatial depth resolution of the image data obtained, the method according to the invention comprises the following steps: an electromagnetic wave is beamed onto the surface of a photonic mixed element comprising at least one pixel, the pixel having at least two lightsensitive modulation light gates G<sub>am</sub> and G<sub>bm</sub> and associated accumulation gates G<sub>a</sub> and  $G_b$ ; modulation light gate voltages  $U_{am}(t)$  and  $U_{bm}(t)$ , which are configured as  $U_{am}(t)$  $U_o + U_m(t)$  and  $U_{bm}(t) = U_o - U_m(t)$ , are applied to the modulation light gates  $G_{am}$  and G<sub>bm</sub>; a direct voltage, whose magnitude is at least the same as that of the total of U<sub>o</sub> and the amplitude of the modulation voltage U<sub>m</sub>(t), is applied to the accumulation gates G<sub>a</sub> and G<sub>b</sub>; the charge carriers produced in the space charge region of the modulation light gates  $G_{\mbox{\tiny am}}$  and  $G_{\mbox{\tiny bm}}$  by the incident electromagnetic wave are subjected, as a function of the polarity of the modulation light gate voltages  $U_{am}(t)$  and  $U_{bm}(t)$ , to the potential gradient of a drift field and drift to the corresponding accumulation gate G. or G<sub>b</sub>; and the charges q<sub>a</sub> and q<sub>b</sub> which have drifted to the accumulation gates G<sub>a</sub> and G<sub>b</sub>, respectively, are diverted. The corresponding photonic mixed element has at least one pixel which comprises at least two light-sensitive modulation light gates ( $G_{\mbox{\tiny am}}, G_{\mbox{\tiny bm}}$ ) and accumulation gates (G<sub>1</sub>, G<sub>2</sub>) which are associated with the modulation light gates and are partitioned with respect to the incident electromagnetic wave. A plurality of photonic mixed elements can be assembled to form an array.
